Coby Cotton — Blue Origin NS-22

MoonDAO's first crowdfunded astronaut

Pablo Moncada-Larrotiz

Pablo Moncada-Larrotiz

Founder & Executive
Director, MoonDAO

San Francisco, CA

pablo@moondao.com · @pablo_moncada_

- **Founder of MoonDAO.** First elected Executive Lead, since 2021.
- **Career: Waymo, YouTube, STEL.** Software engineer at Google, then biotech.
- **Core contributor, ConstitutionDAO.** Helped raise \$47M in days for the U.S. Constitution.
- **University of Michigan.** CS, Mechanical Engineering & Business.

"I see decentralization as a way to fix the risks of centralized control over billions of people's lives."

What Is MoonDAO

An onchain community — anyone, anywhere — pooling resources to fund and govern humanity's next steps into space.

OUR MISSION

To accelerate the development of a self-sustaining, self-governing settlement on the Moon.

- **Decentralized.** Governed onchain via the \$MOONEY token.
- **Global & permissionless.** Anyone, anywhere can join, fund, or build.
- **Radically transparent.** Every vote and dollar is public onchain.

\$8M+

Raised onchain
to fund space access

12,000+

\$MOONEY
token holders

80+

Space R&D projects
funded via governance

2

Crowdfunded citizen-
astronauts sent to space

Five Years of Milestones

Team at Blue Origin's launch site

Coby Cotton — 1st MoonDAO astronaut

Zero-gravity training flight

Dr. Eiman Jahangir — 2nd astronaut

Core Initiatives

Human Spaceflight

Two crowdfunded citizens sent to space by onchain vote.

Fund Space R&D

\$600K+ allocated to 80+ projects via open governance.

Space Training

Zero-gravity flights and astronaut-prep experiences.

Space Acceleration Network

An onchain “startup society” for the space industry.

Transparent Governance

Every vote and treasury move, public onchain.

Lunar Settlement Roadmap

Constitution, Launchpad, and missions — building toward the Moon.

THE NEXT OPPORTUNITY

Go to Space with Frank White

Funding a flight for the author of “The Overview Effect” — and one MoonDAO community member — to finally see Earth from space.

Who Is Frank White

Frank White

Author, "The Overview Effect"

- **Coined "the Overview Effect."** The name for the shift astronauts feel seeing Earth from space.
- **40 years of research.** Interviewed 50+ astronauts and cosmonauts.
- **Shaped the industry.** Co-founded the Overview Institute; inspired a documentary.
- **Has never been to space.**

"Astronauts describe seeing Earth from space as an instant, visceral realization that we share one planet, one atmosphere, one destiny — the Overview Effect."

Fly to Space with Frank White

\$172K of \$250K

157 contributors
goal secures a seat

Top candidates — 25 advance to Round 2

- 

Andrew "Titan" Parris
2,083 \$OVERVIEW
- 

Citizen #180
680 \$OVERVIEW
- 

Jas
652 \$OVERVIEW

Any Citizen can enter and climb the board.

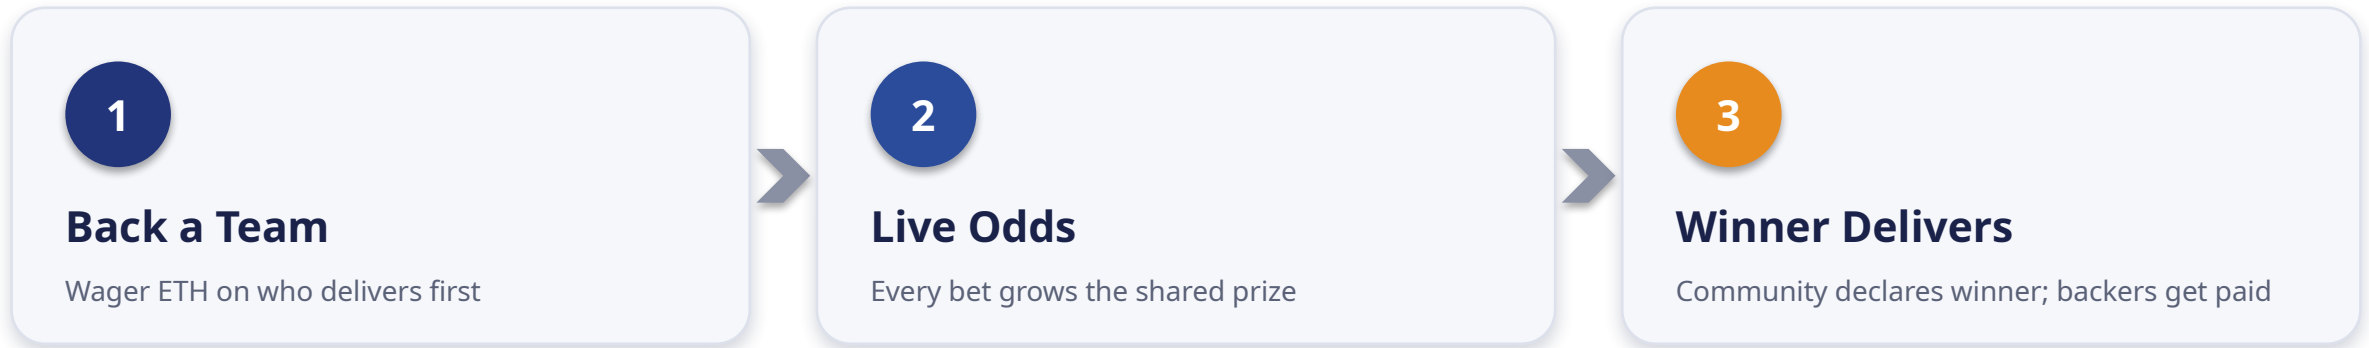

**Support Frank &
Back a Candidate**

moondao.com/overview-vote

\$100+ grants free citizenship — and a shot at flying alongside Frank.

DePrize: A Prediction Market for Space Delivery

THE MATH, WORKED

- Bet 1 ETH on a provider priced at 40% odds
- 5% (0.05 ETH) → prize pool · 95% (0.95 ETH) → market, at \$0.40/share = 2.375 shares
- Less the 1% LMSR trade fee → $\approx$ 2.35 shares held
- If that provider wins: shares redeem 1:1 for ETH → $\approx$ 2.32 ETH back

+1.32 ETH

net gain, plus 50 \$OVERVIEW — funded by bettors who backed other providers

Illustrative worked example from MoonDAO's DePrize design — actual payouts depend on live odds when a bet is placed.

Surviving the 354-Hour Lunar Night

THE PHYSICS

354 hrs

of total darkness, every cycle

- The Moon is tidally locked: one rotation = one 29.5-day orbit
- → sunrise to sunrise ("lunar day") = 29.5 Earth days
- → continuous night $\approx$ 14.75 days = 354 hours
- No atmosphere → no convection — heat only radiates away

THE EXTREMES

257°C

swing between sun and shadow

- South Pole sunlit ground: up to 54°C (130°F)
- Nearby permanent shadow: as low as -203°C (-334°F)
- Colder than anywhere ever recorded on Earth
- Regolith insulates the subsurface, but can't power a base

THE MATH

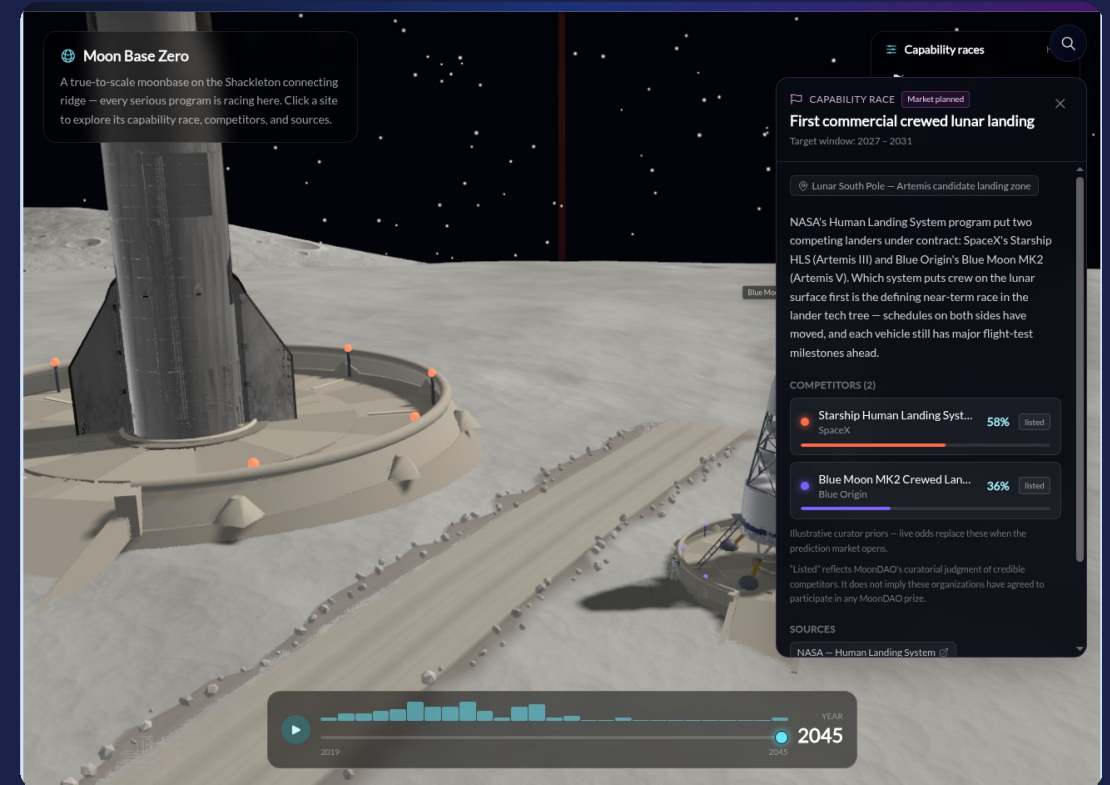

120 tons

of batteries — for one night

- 40 kWe load $\times$ 354 hrs $\approx$ 14,160 kWh needed
- At Tesla Powerwall density (13.5 kWh / 114 kg):
- → $\approx$ 1,050 units $\approx$ 120 metric tons of batteries
- NASA's whole heavy-lander budget: 15 tons, total

THE ANSWER — a 40 kWe fission reactor, shielding, and radiators fit the same 15-ton lander and run for a 10-year design life. NASA calls this civil-space shortfall #1.

Moonbase Zero

Click a race to see live competitors, criteria, and sources

IN DEVELOPMENT

moondao.com/moonbase

A true-to-scale 3D site on the Shackleton connecting ridge — 8 capability races, 24 real competitors, all publicly sourced.

A Level Playing Field for the Next Space Age

Deep space used to require a national agency — or a billionaire.

- **Permissionless.** Any country, company, or individual can fund and compete.
- **Already global.** 25+ countries in the Space Acceleration Network.
- **An open invitation.** To anyone in this room — and your own ecosystem back home.
