Space Acceleration Network

Pablo Moncada-Larrotiz

Pablo Moncada-Larrotiz

Founder & Executive
Director, MoonDAO

San Francisco, CA

pablo@moondao.com · @pablo_moncada_

- **Founder of MoonDAO.** Co-founded and served as the first elected Executive Lead, building an open, onchain platform to fund and govern humanity's return to the Moon since 2021.
- **Career: Waymo, YouTube, STEL.** Software engineer at Google — self-driving perception at Waymo, and YouTube VR — and previously at biotech startup STEL, engineering human tissue.
- **Core contributor, ConstitutionDAO.** Helped build the DAO that raised \$47M in days to bid on an original copy of the U.S. Constitution.
- **University of Michigan.** Studied Computer Science, Mechanical Engineering, and Business; grew up between Michigan and Zaragoza, Spain.

"I used to work at Big Tech, but stepped away after seeing where the world could be headed with centralized control over billions of people's lives. I see decentralization as a way to help fix that."

What Is MoonDAO

An onchain community — anyone, anywhere — pooling resources to fund and govern humanity's next steps into space.

OUR MISSION

To accelerate the development of a self-sustaining, self-governing settlement on the Moon.

- **Decentralized.** Membership, voting, and treasury are governed onchain through the \$MOONEY token — no single point of control.
- **Global & permissionless.** Anyone, anywhere can join as a Citizen, propose a project, contribute funding, or start a Team.
- **Radically transparent.** Every proposal, vote, and treasury transaction is public and verifiable onchain.

\$8M+

Raised onchain
to fund space access

12,000+

\$MOONEY
token holders

80+

Space R&D projects
funded via governance

2

Crowdfunded citizen-
astronauts sent to space

Five Years of Milestones

Core Initiatives

Human Spaceflight

Sent two crowdfunded, community-selected citizens to space via open, onchain voting.

Fund Space R&D

\$600K+ allocated to 80+ projects through transparent community governance.

Space Training

Zero-gravity flights and astronaut-preparation experiences for the community.

Space Acceleration Network

An onchain "startup society" connecting builders, teams, and citizens across the space industry.

Transparent Governance

Every proposal, vote, and treasury movement is public and verifiable onchain.

Lunar Settlement Roadmap

Constitution, Launchpad, and mission funding building toward a self-governing settlement on the Moon.

THE NEXT OPPORTUNITY

Go to Space with Frank White

Funding a flight for the author of “The Overview Effect” — and one MoonDAO community member — to finally see Earth from space.

Who Is Frank White

Frank White

Author, "The Overview Effect"

- **Coined "the Overview Effect."** His 1987 book — now in its 4th edition — named the cognitive shift astronauts describe when they see Earth as one fragile, borderless whole.
- **Nearly 40 years of research.** Interviewed more than 50 astronauts and cosmonauts about how spaceflight changed the way they see our planet.
- **Shaped the industry's language.** Co-founded the Overview Institute; his work inspired the documentary "Overview," viewed nearly 8 million times.
- **Has never been to space.**

"Earthrise," Apollo 8, 1968

"Astronauts describe seeing Earth from space as an instant, visceral realization that we share one planet, one atmosphere, one destiny — the Overview Effect."

Fly to Space with Frank White

\$172K raised of a \$250K goal

157 contributors so far

Hitting \$250K secures a flight seat for a community member to fly alongside Frank — funds are held in escrow until then.

How the community selects the Candidate

1

Contribute \$100+

Grants free MoonDAO citizenship — required to enter the selection process.

2

Community backing + essay

Candidates share what the Overview Effect means to them and build public support.

3

Astronaut review committee

Professional and commercial astronauts evaluate the remaining candidates.

4

Final governance vote

MoonDAO's \$vMOONEY holders vote to select who flies alongside Frank.

DePrize: Betting to Fund the Mission

01**Back a Provider**

Community members wager ETH on which launch provider — e.g. Virgin Galactic or Zephalto — will deliver the flight first.

02**Live, Onchain Odds**

Every bet grows a shared prize pool and produces real-time, transparent odds — a prediction market for space delivery.

03**Winner Delivers, Prize Pays Out**

The community declares a winner; the provider is paid in milestones tied to delivery, and backers of the winner are rewarded.

THE MATH, WORKED

- Bet 1 ETH on a provider priced at 40% odds
- 5% (0.05 ETH) → prize pool · 95% (0.95 ETH) → market, at \$0.40/share = 2.375 shares
- Less the 1% LMSR trade fee → $\approx$ 2.35 shares held
- If that provider wins: shares redeem 1:1 for ETH → $\approx$ 2.32 ETH back

+1.32 ETH

net gain, plus 50 \$OVERVIEW — funded by bettors who backed other providers

Illustrative worked example from MoonDAO's DePrize design — actual payouts depend on live odds when a bet is placed.

Moonbase Zero: Racing to the Lunar South Pole

A true-to-scale, interactive 3D site model — built on real NASA terrain data

- **Real ground, real scale.** A 16×16 km patch of the Shackleton connecting ridge, modeled from NASA LOLA elevation data at 5 m/pixel — not a stylized globe.
- **Every declared competitor, placed.** Each organization's actual hardware stands on its own plot, sized and sited from public mission data, with sources cited.
- **A decade on a timeline.** A year-by-year scrubber reveals sites and milestones as their real target dates arrive, from today through 2035.
- **Built to connect to DePrize.** Every capability race is designed to link to a prediction market, so the community can back — and help fund — who it believes will actually deliver.

Case Study: Surviving the 14-Day Lunar Night

Why this is the closest-run race on the board

THE PHYSICS

Lunar day (sunrise to sunrise) = 29.5 Earth days

→ continuous darkness $\approx$ 14.75 days = 354 hours

No sunlight → solar panels alone cannot power a base

THE MATH

A 40 kWe base load $\times$ 354 hours $\approx$ 14,160 kWh needed per lunar night — just to keep the lights on.

A Tesla Powerwall stores 13.5 kWh → $\approx$ 1,050 of them, replaced every single cycle. Batteries don't scale to this.

That's why NASA funded fission, not solar-plus-storage — and why Moonbase Zero tracks it as a live capability race the community can follow.

CAPABILITY RACE · MARKET PLANNED

First operational fission surface power on the Moon

Target window: 2028 – 2035

Lockheed Martin

35%

Fission Surface Power Reactor

Westinghouse

34%

eVinci Lunar Microreactor

Intuitive Machines (IX)

31%

IX Fission Surface Power Reactor

PASS/FAIL CRITERIA

- $\geq$ 40 kWe for $\geq$ 354 hours without solar input
- Autonomous start-up, load-following, safe shutdown
- 10-year design life, demonstrated by test
- Mass/envelope fits one human-class lander

A Level Playing Field for the Next Space Age

For most of history, deep-space activity has been the domain of a handful of national agencies — and, more recently, a handful of billionaires.

- **Permissionless participation.** Decentralized, onchain tools mean any country, company, university, or individual can fund, compete in, and benefit from lunar-economy activity — not just legacy space powers.
- **Already global.** The Space Acceleration Network connects citizens across 25+ countries with the funding, tools, and visibility to build — including a growing community in Latin America.
- **An open invitation.** To Brazil's space ecosystem — AEB, GRU, universities, and industry — to plug into a transparent, global network built for exactly the next phase of space development this panel is about.
